

Interesting facts about water, energy and the human system

Excerpts from the book 'DNA: Pirates of the Sacred Spiral' by Leonard Horowitz, 2004.

During the 1990's, 3 Nobel laureates in Medicine advanced research revealed the primary function of DNA is not in protein synthesis, but in electromagnetic energy reception and transmission. Less than 3% of DNA's function is protein manufacture. 90% of DNA functions in the realm of Bioacoustic and Bioelectric signalling.

DNA - Structured water-protein crystal-lattice complex.

- Works as an antenna to receive sound (phonons) and translates this sound into light (photons) throughout the organism.

This is working with 'Nature Orally' ie. Naturally.

H₂O - Molecular structure of the Tetrahedron, most stable structure in the physical universe (pyramid power).

Clustered water has clusters or long strings of ordered molecules. This increases its electrical signalling.

Studies have shown that all proteins and chromosomes in cells have a layer of bound water around or with in them about 10 molecules thick. Given this, when an enzyme reacts with a substrate, the only substance that actually touches the substrate molecule is energized water. Since other substances in cells are also coated with packed water, the chemical reactions taking place in your body are mostly interactions of shaped layer of water molecules.

Acoustic and electromagnetic fields change the structure of water and this in turn changes the shape of DNA and alters related genetic expression.

In the case of DNA, when structured body water receives a certain frequency, that energy pattern can enter the cell nucleus, affecting the packed water around DNA, and change the genetic code leading to different patterns of gene expression.

Biochemist Steve Chemiske says these mostly hexagonal shaped water rings supporting the DNA double helix, 'vibrate at specific resonate frequencies and these frequencies can help restore homeostasis to cell structures in the body through signal transduction'..... the process by which one form of energy is converted to another.

According to author, Leonard G Horowitz, the structure of more than 4000 enzymes that regulate virtually every body function largely depends on these hexagonal and pentagonal shaped water clusters communication to the enzymes through an intracellular 'nano-structured' filament-like protein lattice.

DNA molecules = Generators of radio-frequency signals.

RNA molecules = Amplifiers.

Enzymes and Amino Acids = Effectors of signal coded in various regions of the spectrum.

Cell wall = believed to act as a noise filter.
